Subject-matter: **Dalekovod successfully completes yet another project in Norway**

Zagreb, October 25th, 2013 – The company Dalekovod d.d. has successfully completed an exceedingly demanding project of constructing the 420 k/V TL Sima-Samnanger transmission line at Hardangerfjord in Norway.

Work on the transmission line in question started in October 2010 and was completed in October 2013, a month before the agreed deadline. The construction took place in difficult terrain and in unfavorable weather conditions. On the 105 km-long section the transmission line crosses three fjords (22 km-long Osafjord, 2.8 km-long Granvinfjord, 2 km-long Fykkesundfjord). Dalekovod has built the transmission line over the last two fjords, while 305 pillars were constructed along the whole section.

Over 200 workers were employed for this project. Due to difficult terrain the construction was performed with the help of helicopters, with no serious incidents occurring. The launching of the transmission line is planned for the end of the year.

Hardangerfjord is the second largest fjord in Norway and the third largest in the world. It abounds with natural beauty and is of great significance for tourism in Norway. Consequently, all the work was performed in accordance with the most modern methods of environmental protection and conservation.
